

Using Explicit Array to Create Dummy Variables from Categorical Variable in SAS¹

```
** dichot.sas ;
title1 'Dichot.sas, Create dummy variables with explicit array' ;
** First I will read data into a variable "relig" ;
** the "@@" tells SAS to stay on the same line and in the same ;
** column after a variable is read ;
data one ; input relig @@ ;
datalines ;
1 2 3 4 5 1 2 3 4 5 1 2 3 4 5 1 2 3 4 5 1 2 3 4 5
;
data two ; set one ;
** I will now use an explicit array to create dictomous variables ;
** from this categorical variable. I know that there are five ;
** categories. I start an explicit array. ;
** The array's name is "dumvar", and there are five "elements" ;
** in the array. With the following line, I create five variables;
** They are: cathlic protstnt jewish moslem buddhst ;
array dumvar{5} cathlic protstnt jewish moslem buddhst ;
** I start a do loop. The values of "i" will range from 1 to five ;
do i = 1 to 5 ;
** With the next line, I set the value of the new variables to 0 ;
if dumvar{i} = . then dumvar{i} = 0 ;
** Next, change the value of the new variables to 1 if "relig" is the ;
** same value as "i" ;
if relig = i then dumvar{i} = 1 ;
end ;
proc sort; by relig ;
proc print ; run ;
```
