*KANYE WEST'S 1<sup>ST</sup> SOLO TOUR IN 5 YEARS*  
(kicks off in Seattle tonight)

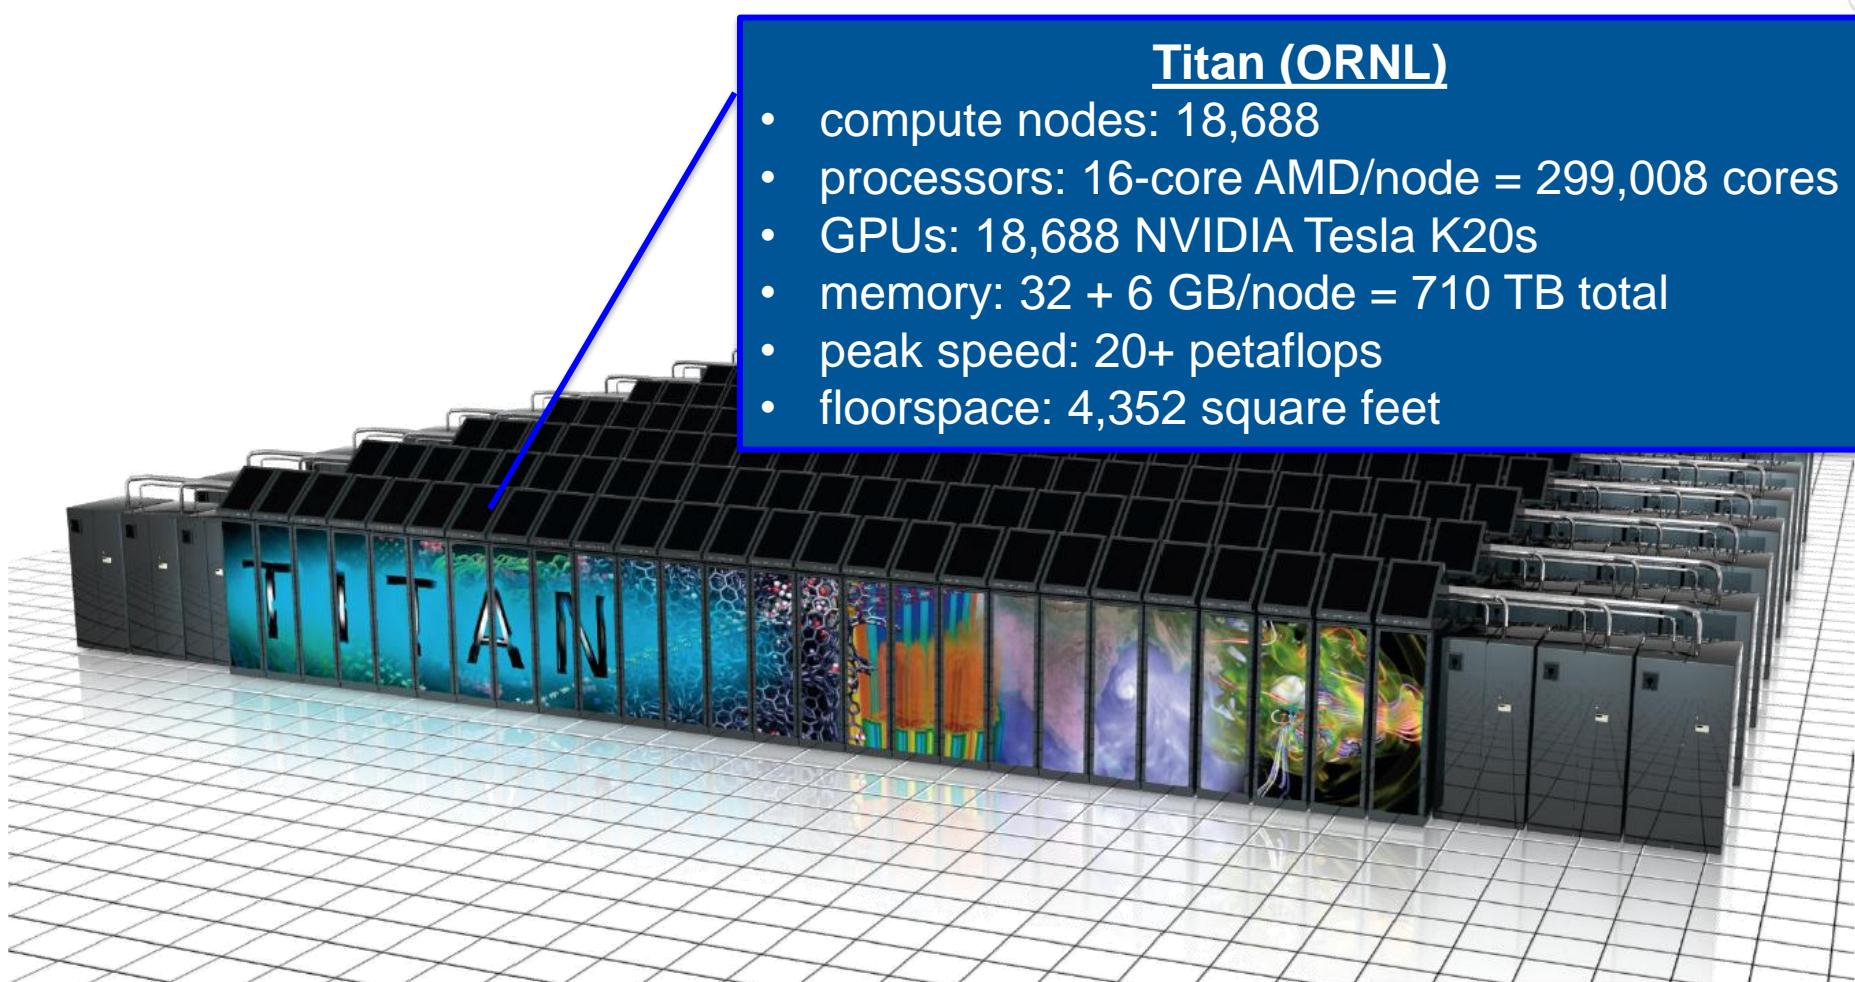

## Chapel: “That \$#!^’s Cray”

# My Employer:

# TITAN

## Titan (ORNL)

- compute nodes: 18,688
- processors: 16-core AMD/node = 299,008 cores
- GPUs: 18,688 NVIDIA Tesla K20s
- memory: 32 + 6 GB/node = 710 TB total
- peak speed: 20+ petaflops
- floorspace: 4,352 square feet

For more information: <http://www.olcf.ornl.gov/titan/>

# Blue Waters

## Blue Waters (NCSA)

- compute nodes: 25,712
- processors: 386,816 AMD cores
- GPUs: 3,072 NVIDIA Kepler GPUs
- memory: 1.476 PB total
- peak speed: 11.61 petaflops

<https://bluewaters.ncsa.illinois.edu/>

# Sustained Performance Milestones

## 1 GF – 1988: Cray Y-MP; 8 Processors

- Static finite element analysis

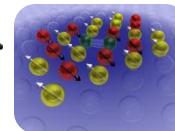

## 1 TF – 1998: Cray T3E; 1,024 Processors

- Modeling of metallic magnet atoms

## 1 PF – 2008: Cray XT5; 150,000 Processors

- Superconductive materials

## 1 EF – ~2018: Cray \_\_\_\_; ~10,000,000 Processors

- TBD

# Sustained Performance Milestones

## 1 GF – 1988: Cray Y-MP; 8 Processors

- Static finite element analysis
- Fortran77 + Cray autotasking + vectorization

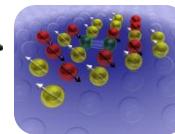

## 1 TF – 1998: Cray T3E; 1,024 Processors

- Modeling of metallic magnet atoms
- Fortran + MPI (Message Passing Interface)

## 1 PF – 2008: Cray XT5; 150,000 Processors

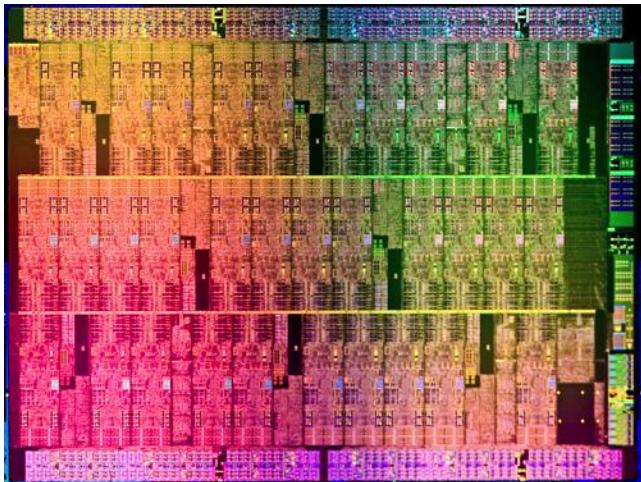

- Superconductive materials
- C++/Fortran + MPI + vectorization

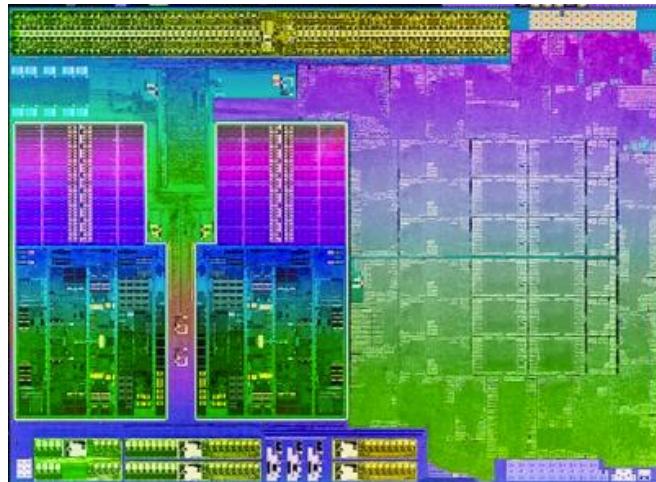

## 1 EF – ~2018: Cray \_\_\_\_; ~10,000,000 Processors

- TBD: C/C++/Fortran + MPI + CUDA/OpenCL/OpenMP/OpenACC?

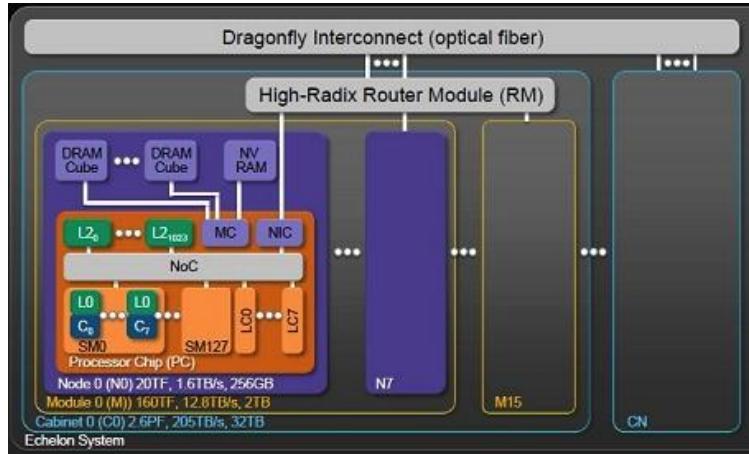

# Prototypical Next-Gen Processor Technologies

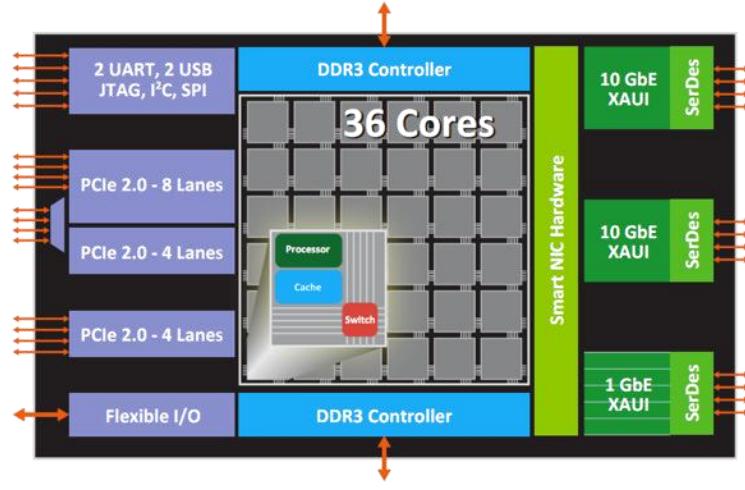

Intel MIC

AMD Trinity

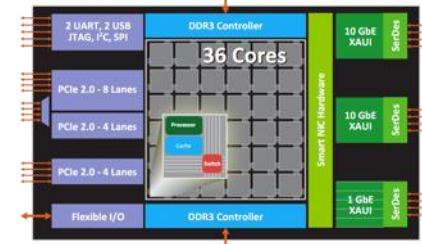

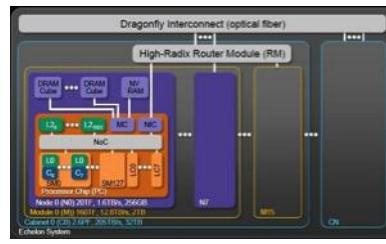

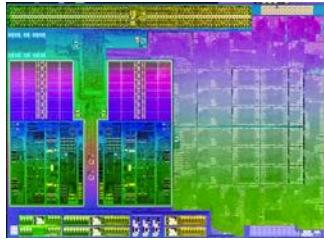

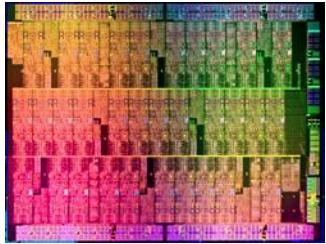

Nvidia Echelon

Tilera Tile-Gx

# General Characteristics of These Architectures

- Increased hierarchy and/or sensitivity to locality
- Potentially heterogeneous processor/memory types

⇒ Next-gen programmers will have a lot more to think about at the node level than in the past

# Sustained Performance Milestones

    HPCC_free(b);
    HPCC_free(a);

    return 0;
}
```

## CUDA

```
#define N 2000000

int main() {
    float *d_a, *d_b, *d_c;
    float scalar;

    cudaMalloc((void**)&d_a, sizeof(float)*N);
    cudaMalloc((void**)&d_b, sizeof(float)*N);
    cudaMalloc((void**)&d_c, sizeof(float)*N);

    dim3 dimBlock(128);
    if( N % dimBlock.x != 0 ) dimGrid

    set_array<<<dimGrid, dimBlock>>>(d_b, .5f, N);
    set_array<<<dimGrid, dimBlock>>>(d_c, .5f, N);

    scalar=3.0f;
    STREAM_Triad<<<dimGrid, dimBlock>>>(d_b, d_c, d_a, scalar, N);
    cudaThreadSynchronize();

    cudaFree(d_a);
    cudaFree(d_b);
    cudaFree(d_c);

__global__ void set_array(float *a, float value, int len) {
    int idx = threadIdx.x + blockIdx.x * blockDim.x;
    if (idx < len) a[idx] = value;
}

__global__ void STREAM_Triad( float *a, float *b, float *c,
                             float scalar, int len) {
    int idx = threadIdx.x + blockIdx.x * blockDim.x;
    if (idx < len) c[idx] = a[idx]+scalar*b[idx];
}
```

# Why so many programming models?

HPC has traditionally given users...

...low-level, *control-centric* programming models

...ones that are closely tied to the underlying hardware

...ones that support only a single type of parallelism

## Examples:

Type of HW Parallelism	Programming Model	Unit of Parallelism
Inter-node	MPI	executable
Intra-node/multicore	OpenMP/pthreads	iteration/task
Instruction-level vectors/threads	pragmas	iteration
GPU/accelerator	CUDA/OpenCL/OpenACC	SIMD function/task

**benefits:** lots of control; decent generality; easy to implement

**downsides:** lots of user-managed detail; brittle to changes

# (“Glad I’m not an HPC Programmer!”)

## A Possible Reaction:

“This is all well and good for HPC users, but I’m a mainstream desktop programmer, so this is all academic for me.”

## The Unfortunate Reality:

- Performance-minded mainstream programmers will increasingly deal with parallelism
- And, as chips become more complex, locality too

# Rewinding a few slides...

## MPI + OpenMP

```
#ifdef _OPENMP
#include <omp.h>
#endif

static int VectorSize;
static double *a, *b, *c;

int HPCC_StarStream(HPCC_Parms *params) {
    int myRank, commSize;
    int rv, errCount;
    MPI_Comm comm = MPI_COMM_WORLD;
    MPI_Comm_size( comm, &commSize );
    MPI_Comm_rank( comm, &myRank );

    rv = HPCC_Stream( params, 0 == myRank );
    MPI_Reduce( &rv, &errCount, 1, MPI_INT, MPI_SUM, 0, comm );
}

HPC suffers from too many distinct notations for expressing parallelism and locality

int HPCC_Stream(HPCC_Parms *params, int doIO) {
    register int j;
    double scalar;

    VectorSize = HPCC_LocalVectorSize( params, 3, sizeof(double), 0 );

    a = HPCC_XMALLOC( double, VectorSize );
    b = HPCC_XMALLOC( double, VectorSize );
    c = HPCC_XMALLOC( double, VectorSize );

    if (!a || !b || !c) {
        if (c) HPCC_free(c);
        if (b) HPCC_free(b);
        if (a) HPCC_free(a);
        if (doIO) {
            fprintf( outFile, "Failed to allocate memory (%d).\n", VectorSize );
            fclose( outFile );
        }
        return 1;
    }

    #ifdef _OPENMP
    #pragma omp parallel for
    #endif
    for (j=0; j<VectorSize; j++) {
        b[j] = 2.0;
        c[j] = 0.0;
    }

#pragma
#endif
for
ab
HPCC
HPCC
HPCC
return 0;
```

Philosophy: Good language design can tease details of locality and parallelism away from an algorithm, permitting the compiler, runtime, applied scientist, and HPC expert to each focus on their strengths.

# Outline

- ✓ Motivation
- Chapel Background and Themes
- Survey of Chapel Concepts
- Project Status and Next Steps

# What is Chapel?

- An emerging parallel programming language
  - Design and development led by Cray Inc.
    - in collaboration with academia, labs, industry
  - Initiated under the DARPA HPCS program
- Overall goal: Improve programmer productivity
  - Improve the programmability of parallel computers
  - Match or beat the performance of current programming models
  - Support better portability than current programming models
  - Improve the robustness of parallel codes
- A work-in-progress

# Chapel's Implementation

- Being developed as open source at SourceForge
- Licensed as BSD software
- **Target Architectures:**
  - Cray architectures
  - multicore desktops and laptops
  - commodity clusters
  - systems from other vendors
  - *in-progress:* CPU+accelerator hybrids, manycore, ...

# Motivating Chapel Themes

- 1) General Parallel Programming**
- 2) Global-View Abstractions**
- 3) Multiresolution Design**
- 4) Control over Locality/Affinity**
- 5) Reduce HPC ↔ Mainstream Language Gap**

# Motivating Chapel Themes

- 1) General Parallel Programming**
- 2) Global-View Abstractions**
- 3) Multiresolution Design**
- 4) Control over Locality/Affinity**
- 5) Reduce HPC ↔ Mainstream Language Gap**

# 1) General Parallel Programming

With a unified set of concepts...

...express any parallelism desired in a user's program

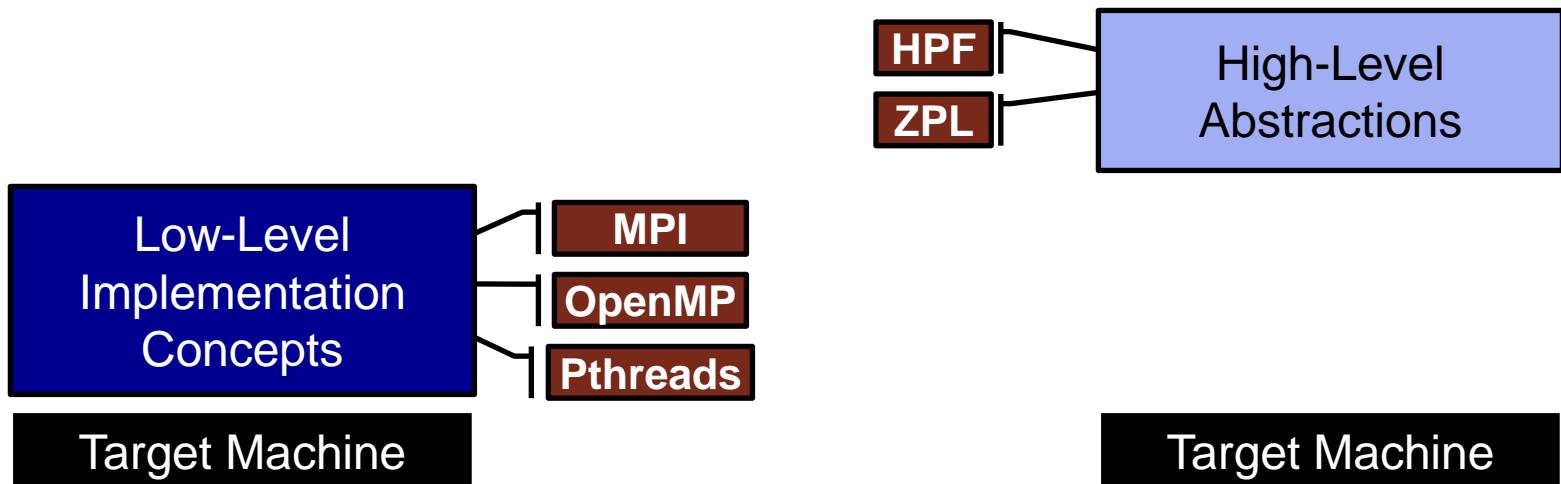

- **Styles:** data-parallel, task-parallel, concurrency, nested, ...
- **Levels:** model, function, loop, statement, expression

...target any parallelism available in the hardware

- **Types:** machines, nodes, cores, instructions

Type of HW Parallelism	Programming Model	Unit of Parallelism
Inter-node	Chapel	executable/task
Intra-node/multicore	Chapel	iteration/task
Instruction-level vectors/threads	Chapel	iteration
GPU/accelerator	Chapel	SIMD function/task

### 3) Multiresolution Design: Motivation

*“Why is everything so tedious/difficult?”*

*“Why don’t my programs port trivially?”*

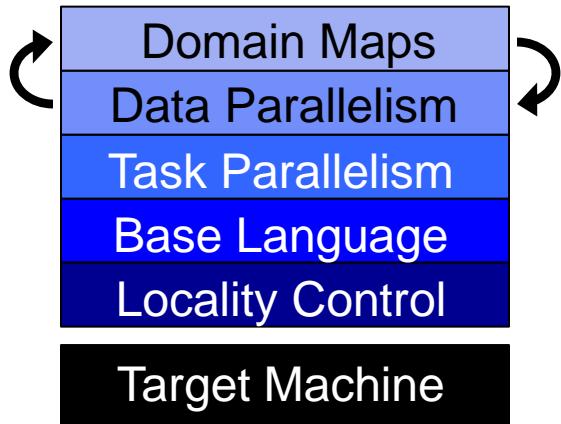

*“Why don’t I have more control?”*

### 3) Multiresolution Design

#### **Multiresolution Design:** Support multiple tiers of features

- higher levels for programmability, productivity
- lower levels for greater degrees of control

*Chapel language concepts*

- build the higher-level concepts in terms of the lower
- permit the user to intermix layers arbitrarily

## 5) Reduce HPC ↔ Mainstream Language Gap

### Consider:

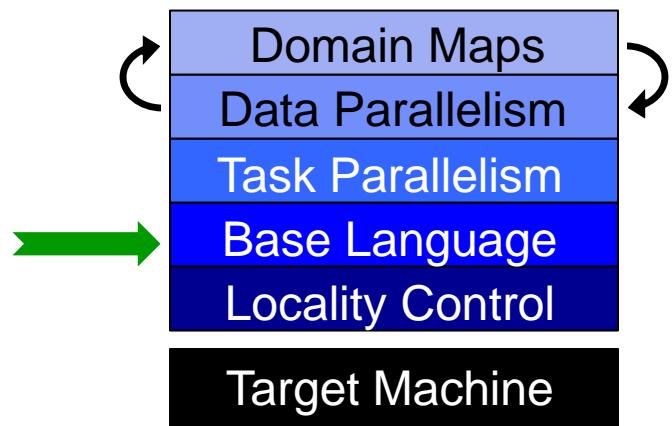

- Students graduate with training in Java, Matlab, Python, etc.
- Yet HPC programming is dominated by Fortran, C/C++, MPI

### We'd like to narrow this gulf with Chapel:

- to leverage advances in modern language design
- to better utilize the skills of the entry-level workforce...
- ...while not alienating the traditional HPC programmer
  - e.g., support object-oriented programming, but make it optional

# Outline

- Project Status and Next Steps

# Static Type Inference

```
const pi = 3.14,           // pi is a real
      coord = 1.2 + 3.4i, // coord is a complex...
      coord2 = pi*coord, // ...as is coord2
      name = "brad",     // name is a string
      verbose = false;   // verbose is boolean

proc addem(x, y) {         // addem() has generic arguments
    return x + y;          // and an inferred return type
}

var sum = addem(1, pi),    // sum is a real
    fullname = addem(name, "ford"); // fullname is a string

writeln((sum, fullname));
```

(4.14, bradford)

# Range Types and Algebra

```
const r = 1..10;

printVals(r # 3);
printVals(r by 2);
printVals(r by -2);
printVals(r by 2 # 3);
printVals(r # 3 by 2);
printVals(0.. #n);

proc printVals(r) {
    for i in r do
        write(r, " ");
        writeln();
}
```

```
1 2 3
1 3 5 7 9
10 8 6 4 2
1 3 5
1 3
0 1 2 3 4 ... n-1
```

# Iterators

```
iter fibonacci(n) {
    var current = 0,
        next = 1;
    for 1..n {
        yield current;
        current += next;
        current <= next;
    }
}
```

```
for f in fibonacci(7) do
    writeln(f);
```

```
0
1
1
2
3
5
8
```

```
iter tiledRMO(D, tilesize) {
    const tile = {0..#tilesize,
                  0..#tilesize};
    for base in D by tilesize do
        for ij in D[tile + base] do
            yield ij;
}
```

```
for ij in tiledRMO({1..m, 1..n}, 2) do
    write(ij);
```

```
(1,1) (1,2) (2,1) (2,2)
(1,3) (1,4) (2,3) (2,4)
(1,5) (1,6) (2,5) (2,6)
...
(3,1) (3,2) (4,1) (4,2)
```

# Zippered Iteration

```
for (i,f) in zip(0..#n, fibonacci(n)) do  
    writeln("fib #", i, " is ", f);
```

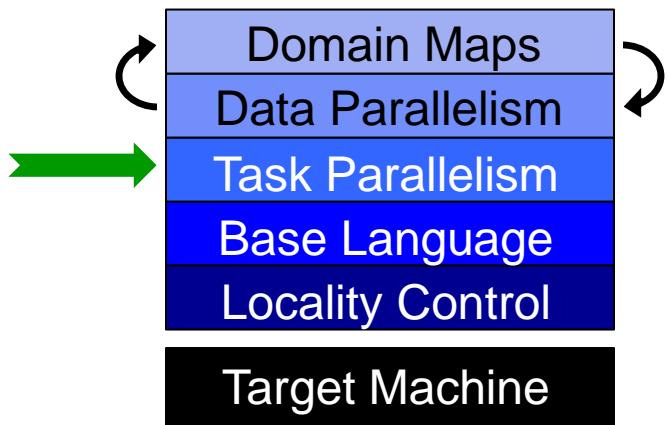

```
fib #0 is 0  
fib #1 is 1  
fib #2 is 1  
fib #3 is 2  
fib #4 is 3  
fib #5 is 5  
fib #6 is 8  
...
```

# Other Base Language Features

- **tuple types and values**
- **rank-independent programming features**
- **interoperability features**
- **compile-time features for meta-programming**
  - e.g., compile-time functions to compute types, parameters
- **OOP (value- and reference-based)**
- **argument intents, default values, match-by-name**
- **overloading, where clauses**
- **modules (for namespace management)**
- ...

# Outline

- ✓ Motivation
- ✓ Chapel Background and Themes
- Survey of Chapel Concepts

- Project Status and Next Steps

# Task Parallelism: Begin Statements

```
// create a fire-and-forget task for a statement
begin writeln("hello world");
writeln("good bye");
```

## Possible outputs:

hello world  
good bye

good bye  
hello world

# Task Parallelism: Coforall Loops

```
// create a task per iteration
coforall t in 0..#numTasks {
    writeln("Hello from task ", t, " of ", numTasks);
} // implicit join of the numTasks tasks here

writeln("All tasks done");
```

## Sample output:

```
Hello from task 2 of 4
Hello from task 0 of 4
Hello from task 3 of 4
Hello from task 1 of 4
All tasks done
```

# Bounded Buffer Producer/Consumer Example

```
begin producer();
consumer();

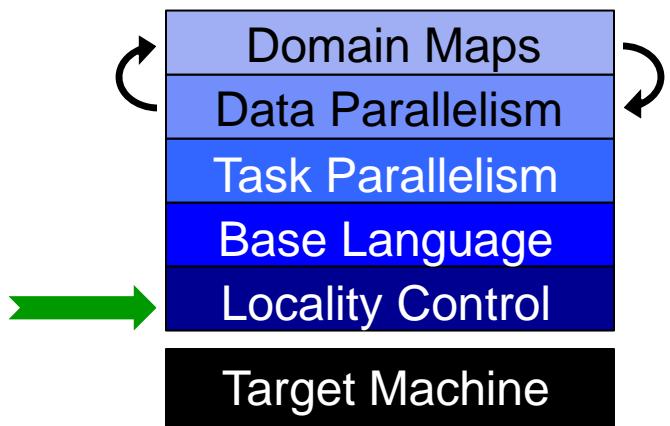

// 'sync' types store full/empty state along with value
var buff$: [0..#buffersize] sync real;

proc producer() {
    var i = 0;
    for ... {
        i = (i+1) % buffersize;
        buff$[i] = ...; // writes block until empty, leave full
    }
}

proc consumer() {
    var i = 0;
    while ... {
        i= (i+1) % buffersize;
        ...buff$[i]...; // reads block until full, leave empty
    }
}
```

Theme 4: Control over  
Locality/Affinity

- Project Status and Next Steps

# The Locale Type

## Definition:

- Abstract unit of target architecture
- Supports reasoning about locality
- Capable of running tasks and storing variables
  - i.e., has processors and memory

**Typically:** A compute node (multicore processor or SMP)

# Defining Locales

- Specify # of locales when running Chapel programs

```
% a.out --numLocales=8
```

```
% a.out -nl 8
```

- Chapel provides built-in locale variables

```
config const numLocales: int = ...;  
const Locales: [0..#numLocales] locale = ...;
```

*Locales*

- User's main() begins executing on locale #0

# Locale Operations

- Locale methods support queries about the target system:

```
proc locale.physicalMemory(...) { ... }  
proc locale.numCores { ... }  
proc locale.id { ... }  
proc locale.name { ... }
```

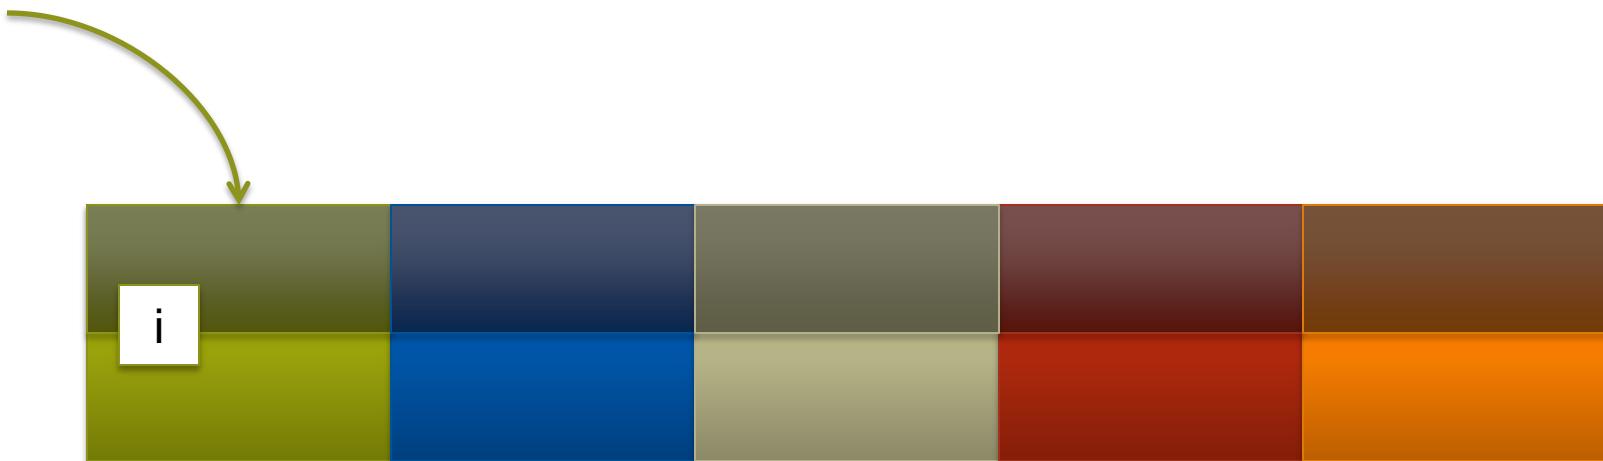

- On-clauses support placement of computations:

```
writeln("on locale 0");  
on Locales[1] do  
  writeln("now on locale 1");  
writeln("on locale 0 again");
```

```
begin on A[i,j] do  
  bigComputation(A);  
  
begin on node.left do  
  search(node.left);
```

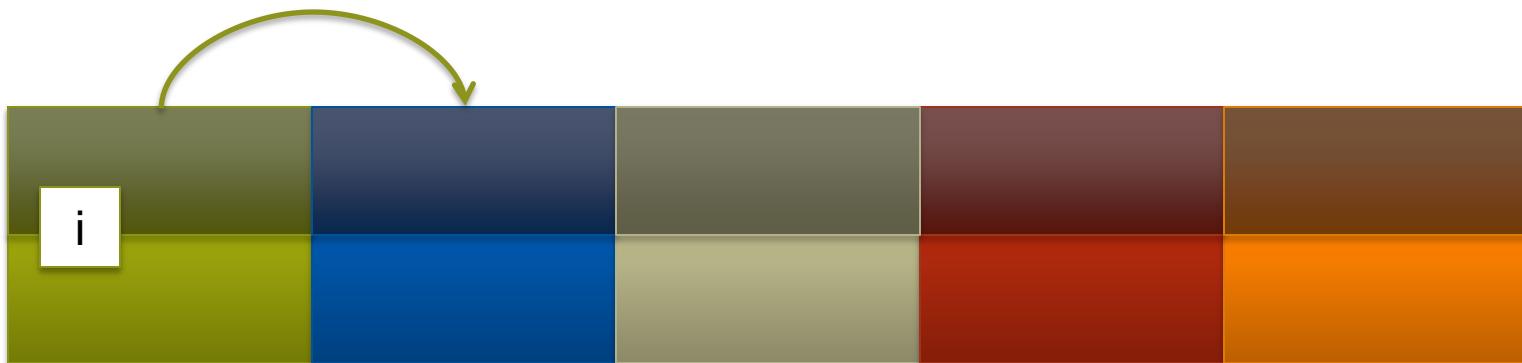

# Chapel: Scoping and Locality

```
var i: int;
```

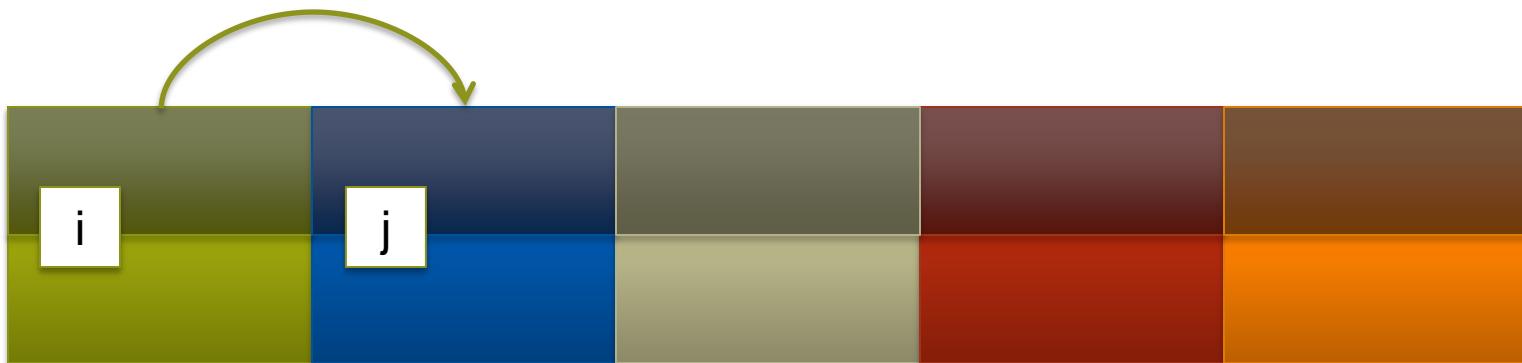

# Chapel: Scoping and Locality

```
var i: int;  
on Locales[1] {
```

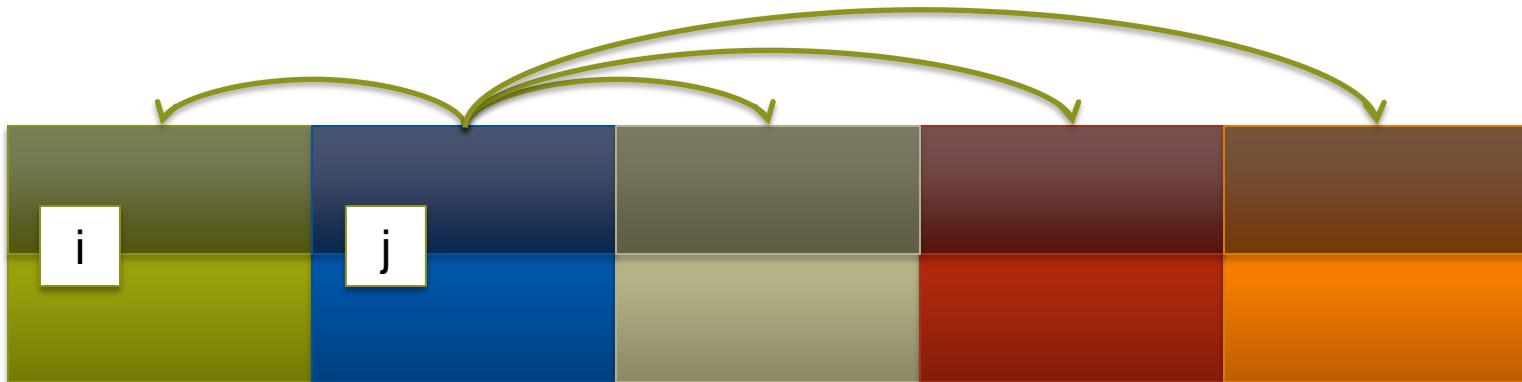

# Chapel: Scoping and Locality

```
var i: int;  
on Locales[1] {  
    var j: int;
```

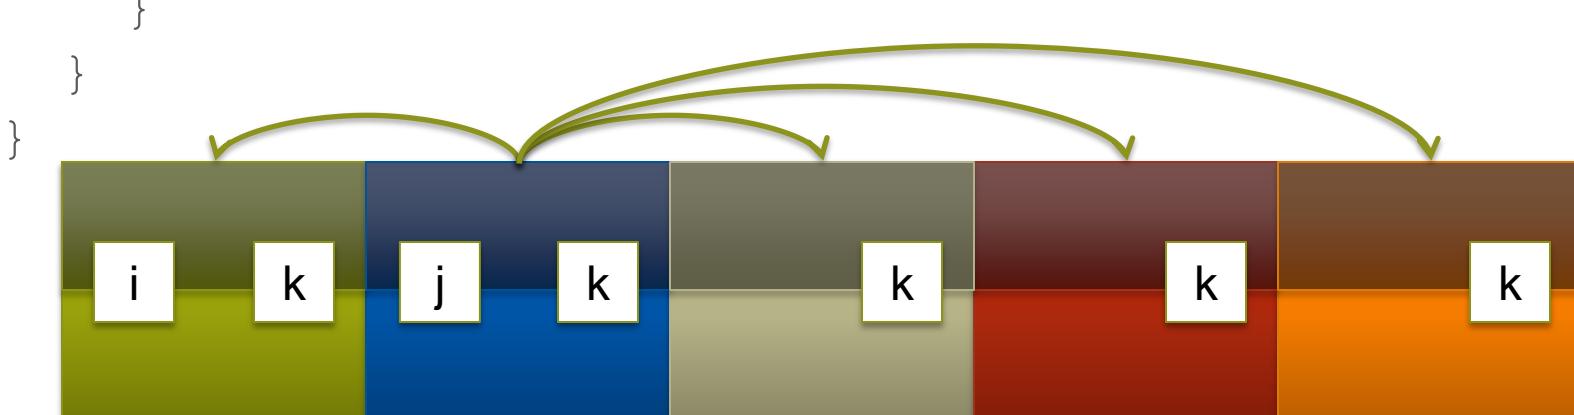

# Chapel: Scoping and Locality

```
var i: int;  
on Locales[1] {  
    var j: int;  
    coforall loc in Locales {  
        on loc {
```

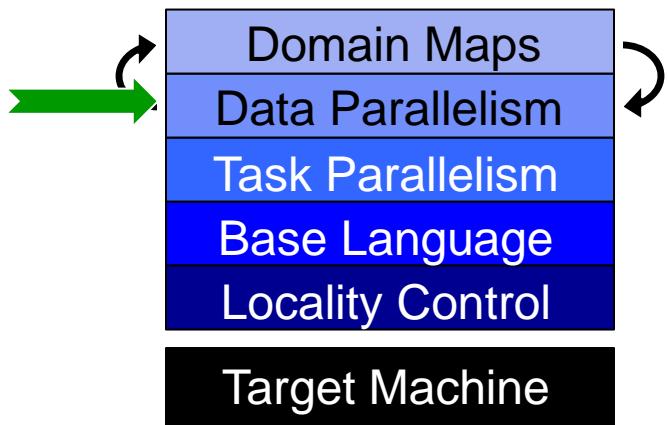

# Chapel: Scoping and Locality

```
var i: int;  
on Locales[1] {  
    var j: int;  
    coforall loc in Locales {  
        on loc {  
            var k: int;  
  
            // within this scope, i,j,k can be referenced;  
            // the implementation manages the communication  
        }  
    }  
}
```

# Outline

# Domains

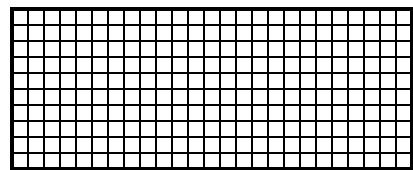

## **Domain:**

- A first-class index set
- The fundamental Chapel concept for data parallelism

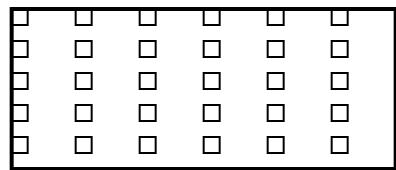

```
config const m = 4, n = 8;  
  
var D: domain(2) = {1..m, 1..n};  
  
var Inner: subdomain(D) = {2..m-1, 2..n-1};
```

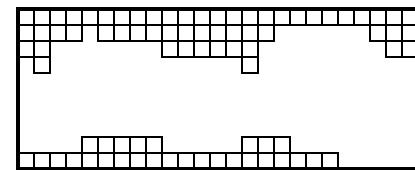

# Chapel Domain Types

*dense*

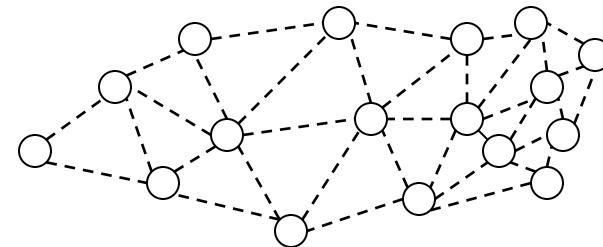

*strided*

*sparse*

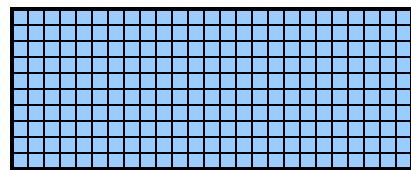

*associative*

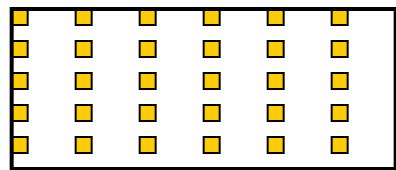

*unstructured*

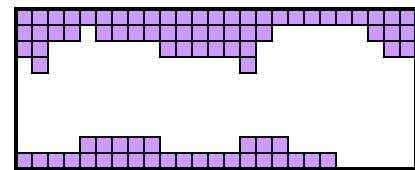

# Chapel Array Types

*dense*

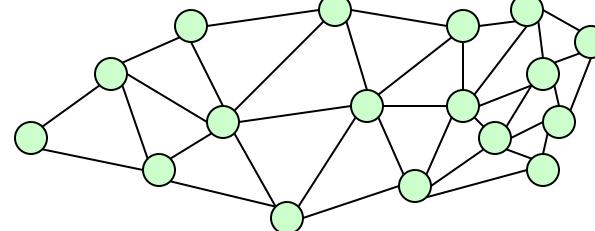

*strided*

*sparse*

*associative*

*unstructured*

# Chapel Domain/Array Operations

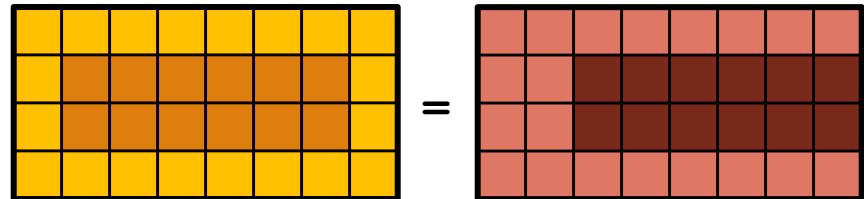

- Data Parallel Iteration (as well as serial and coforall)

```
A = forall (i,j) in D do (i + j/10.0);
```

1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8
2.1	2.2	2.3	2.4	2.5	2.6	2.7	2.8
3.1	3.2	3.3	3.4	3.5	3.6	3.7	3.8
4.1	4.2	4.3	4.4	4.5	4.6	4.7	4.8

- Array Slicing; Domain Algebra

```
A[InnerD] = B[InnerD+(0,1)];
```

- Promotion of Scalar Operators and Functions

```
A = B + alpha * C;
```

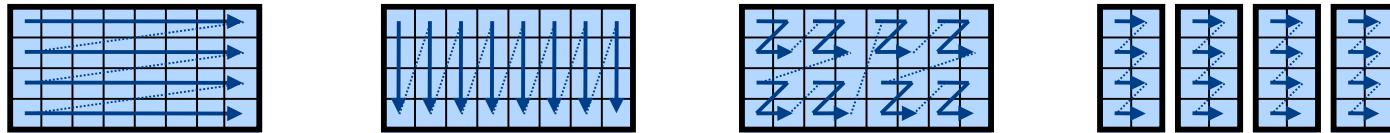

```
A = exp(B, C);
```

- And many others: indexing, reallocation, set operations, remapping, aliasing, queries, ...

# Data Parallelism Implementation Qs

## Q1: How are arrays laid out in memory?

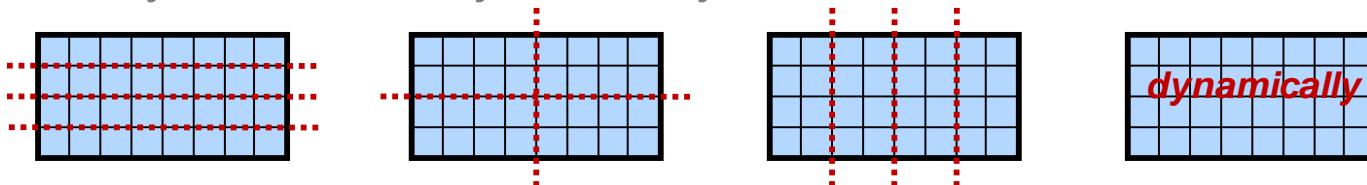

- Are regular arrays laid out in row- or column-major order? Or...?

- How are sparse arrays stored? (COO, CSR, CSC, block-structured, ...?)

## Q2: How are arrays stored by the locales?

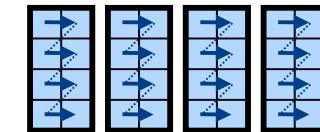

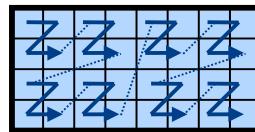

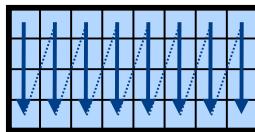

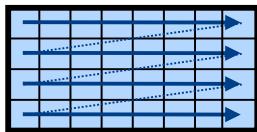

- Completely local to one locale? Or distributed?
- If distributed... In a blocked manner? cyclically? block-cyclically? recursively bisected? dynamically rebalanced? ...?

# Data Parallelism Implementation Qs

## Q1: How are arrays laid out in memory?

- Are regular arrays laid out in row- or column-major order? Or...?

- How are sparse arrays stored? (COO, CSR, CSC, block-structured, ...?)

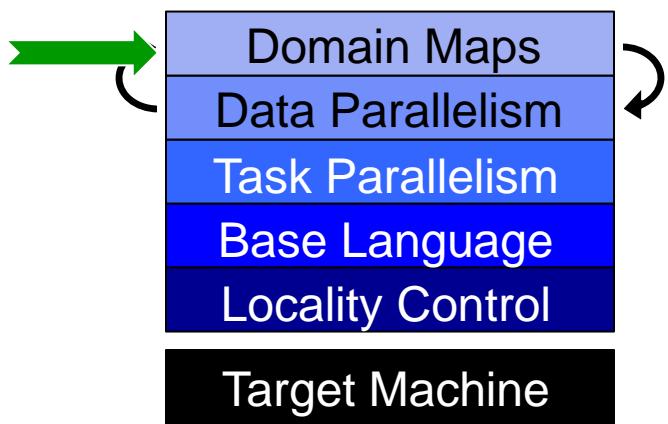

## Q2: How are arrays mapped to the locales?

- Completely local to one locale? Or distributed?
- If distributed... In a blocked manner? cyclically? block-cyclically?  
recursively bisected? dynamically rebalanced? ...?

A: Chapel's *domain maps* are designed to give the user full control over such decisions

# Outline

- ✓ Motivation
- ✓ Chapel Background and Themes
- Survey of Chapel Concepts

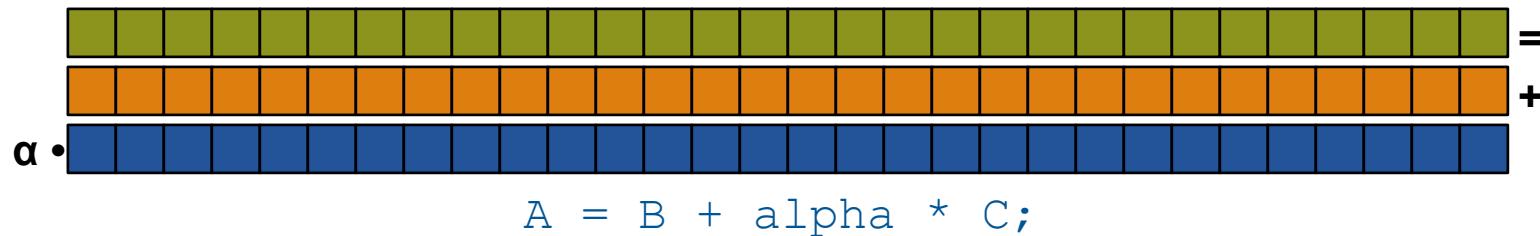

Theme 2: Global-view  
Abstractions

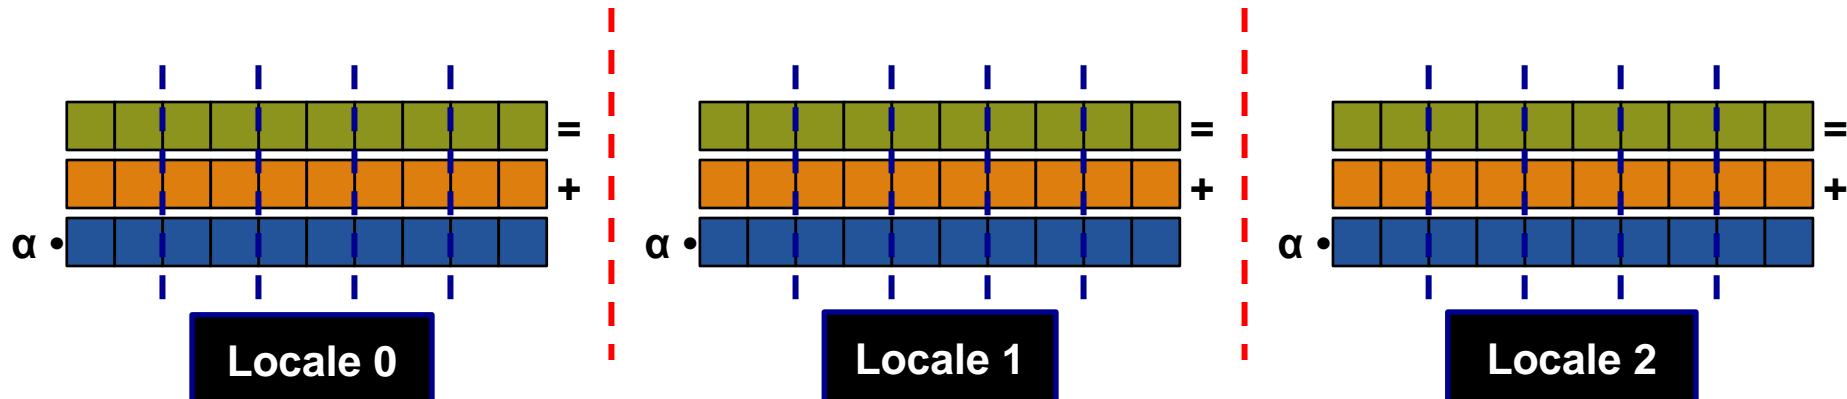

- Project Status and Next Steps

# Domain Maps

Domain maps are “recipes” that instruct the compiler how to map the global view of a computation...

...to the target locales' memory and processors:

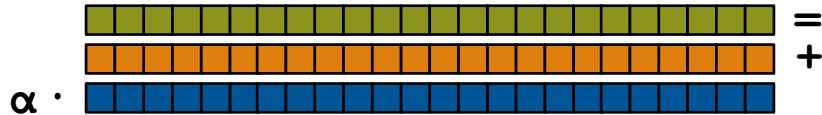

# STREAM Triad: Chapel

```
const ProblemSpace = {1..m};
```

```
var A, B, C: [ProblemSpace] real;
```

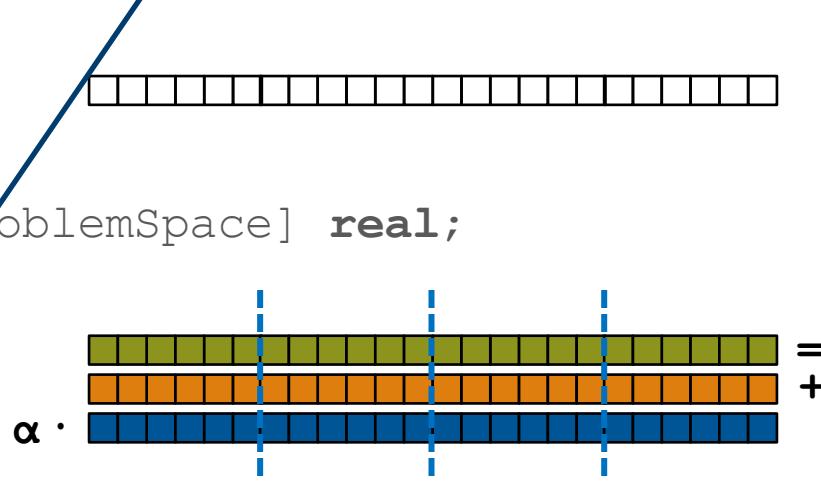

```
A = B + alpha * C;
```

# STREAM Triad: Chapel (multicore)

```
const ProblemSpace = {1..m};
```

```
var A, B, C: [ProblemSpace] real;
```

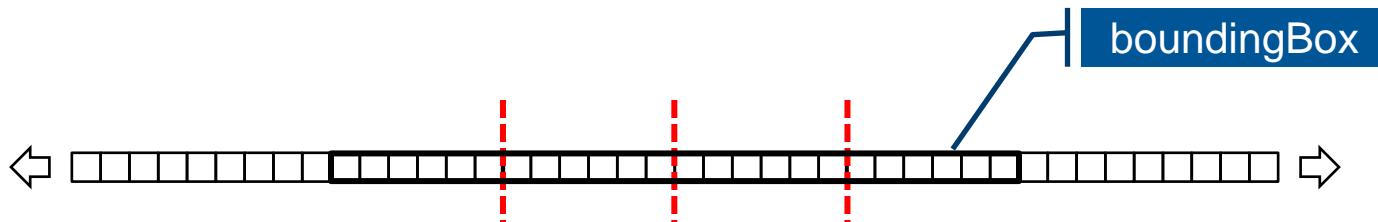

```
A = B + alpha * C;
```

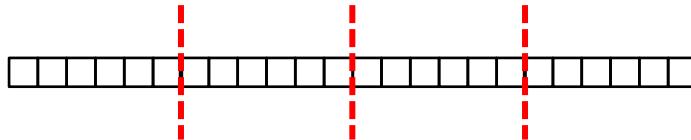

No domain map specified => use default layout

- current locale owns all indices and values
- computation will execute using local processors only

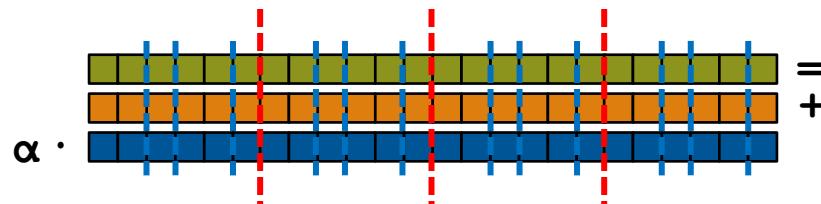

# STREAM Triad: Chapel (multilocale, blocked)

```
const ProblemSpace = {1..m}
dmapped Block (boundingBox={1..m}) ;
```

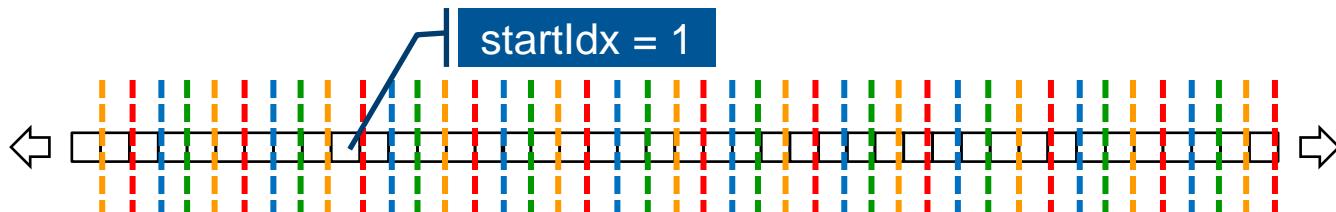

```
var A, B, C: [ProblemSpace] real;
```

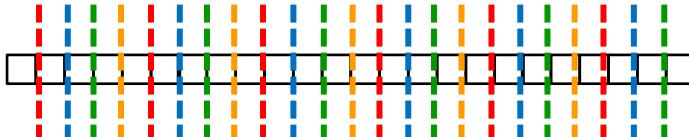

```
A = B + alpha * C;
```

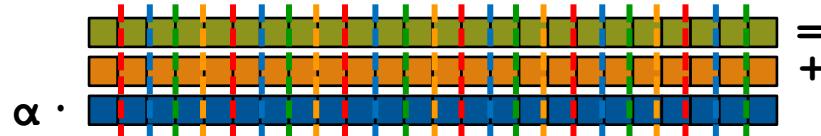

# STREAM Triad: Chapel (multilocale, cyclic)

```
const ProblemSpace = {1..m}
    dmapped Cyclic(startIdx=1);
```

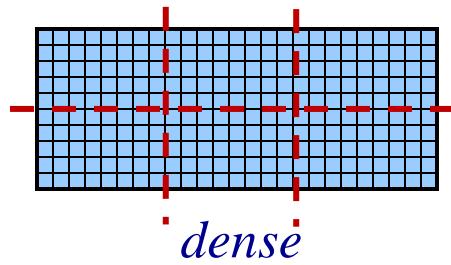

```
var A, B, C: [ProblemSpace] real;
```

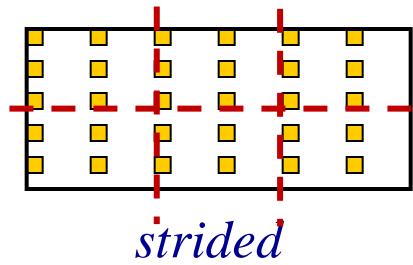

```
A = B + alpha * C;
```

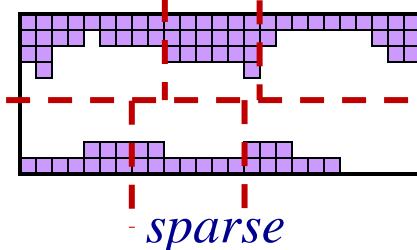

# Domain Map Types

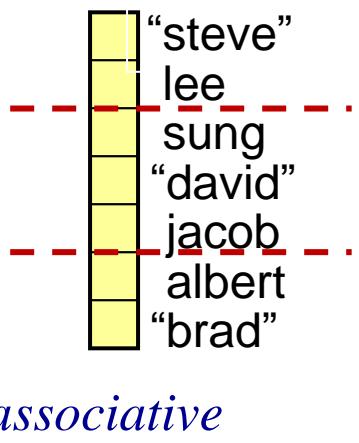

*dense*

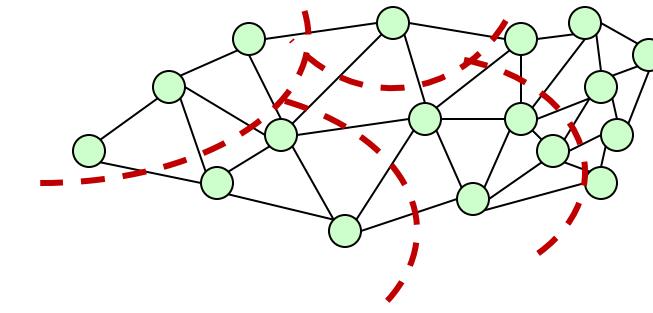

*strided*

*sparse*

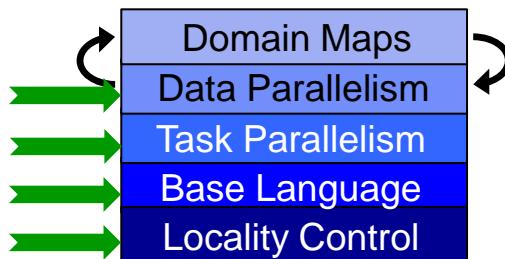

*associative*

*unstructured*

# Chapel's Domain Map Philosophy

- 1. Chapel provides a library of standard domain maps**
  - to support common array implementations effortlessly
- 2. Advanced users can write their own domain maps in Chapel**
  - to cope with shortcomings in our standard library

- 3. Chapel's standard domain maps are written using the same end-user framework**
  - to avoid a performance cliff between “built-in” and user-defined cases

  \$CHPL\_HOME/doc/technotes/README.dsi
- Current domain maps:  
  \$CHPL\_HOME/modules/dists/\*.chpl  
    layouts/\*.chpl  
    internal/Default\*.chpl

# Summary of this Domain Maps Section

- **Chapel avoids locking crucial implementation decisions into the language specification**
  - local and distributed array implementations
  - parallel loop implementations
- **Instead, these can be...**
  - ...specified in the language by an advanced user
  - ...swapped in and out with minimal code changes
- **The result separates the roles of domain scientist, parallel programmer, and implementation cleanly**

# Outline

- ✓ Motivation

- Project Status and Next Steps

# Implementation Status – Version 1.8.0 (Oct 2013)

## Overall Status:

- Most features work at a functional level
  - some features need to be improved or re-implemented (e.g., OOP)
- Many performance optimizations remain
  - particularly for distributed memory (multi-locale) execution

## This is a good time to:

- Try out the language and compiler
- Use Chapel for non-performance-critical projects
- Give us feedback to improve Chapel
- Use Chapel for parallel programming education

# Chapel and Education

- When teaching parallel programming, I like to cover:
  - data parallelism
  - task parallelism
  - concurrency
  - synchronization
  - locality/affinity
  - deadlock, livelock, and other pitfalls
  - performance tuning
  - ...
- I don't think there's been a good language out there...
  - for teaching *all* of these things
  - for teaching some of these things well at all
  - *until now:* We believe Chapel can potentially play a crucial role here  
(see <http://chapel.cray.com/education.html> for more information and  
<http://cs.washington.edu/education/courses/csep524/13wi/> for my use of Chapel in class)

# The Cray Chapel Team (Summer 2013)

# Chapel Community

(and several others as well...)

# Chapel: the next five years

- **Harden Prototype to Production-grade**
  - Performance Optimizations
  - Add/Improve Lacking Features
- **Target more complex/modern compute node types**
  - e.g., CPU+GPU, Intel MIC, ...
- **Continue to grow the user and developer communities**
  - including nontraditional circles: desktop parallelism, “big data”
  - transition Chapel from Cray-controlled to community-governed
- **Grow the team at Cray**
  - four positions open at present (manager, SW eng, build/test/release)

# Summary

***Higher-level programming models can help insulate algorithms from parallel implementation details***

- yet, without necessarily abdicating control
- Chapel does this via its multiresolution design
  - Here, we saw it in domain maps and leader-follower iterators
  - These avoid locking crucial performance decisions into the language

***We believe Chapel can greatly improve productivity***

...for current and emerging HPC architectures

...and for the growing need for parallel programming in the mainstream
