

## Midterm Exam Translation Practice

For practice, **translate** these sentences (English into FOL and FOL into English). Where there is more than one obviously correct answer, alternative (correct) translations are given.

1. If  $a$  is a cube but  $b$  isn't, then neither  $c$  nor  $d$  is large.
2.  $c$  is a large tetrahedron if either  $b$  or  $a$  adjoins  $d$ .
3. If  $d$  is a dodecahedron, then  $c$  isn't; but  $b$  is small only if  $a$  is a cube.
4. Either  $a$  or  $b$  is not small; however,  $c$  is a cube just in case  $d$  is, too.
5. Not both  $a$  and  $b$  adjoin  $c$  unless  $d$  is a dodecahedron.
6.  $(\text{Cube}(c) \wedge \neg \text{Small}(c)) \rightarrow (\text{Adjoins}(c, d) \vee \text{FrontOf}(c, d))$
7.  $\text{Adjoins}(d, c) \leftrightarrow \neg(\text{Large}(b) \wedge \text{Tet}(b))$
8. If either one of  $b$  or  $c$  is left of the other, then at least one of them is large.
9. In the event that  $b$  is a cube that is in the same column as  $d$ ,  $b$  and  $d$  are the same block.
10.  $b$  is a cube, and it is in the same column as  $d$  only if  $b$  and  $d$  are the same block.

Now try translating this argument into FOL.

$d$  is large if it either is a dodecahedron that is not in front of  $c$  or is a cube. If  $d$  is a dodecahedron and is in front of  $c$ , then  $b$  is a tetrahedron.  $d$  is a dodecahedron, but  $b$  is not a tetrahedron. Therefore,  $d$  is large.

Just for fun, can you figure out whether it is valid? Solutions for all the problems can be found on the next page.

## Solutions

### Sentences

1.  $(\text{Cube}(a) \wedge \neg \text{Cube}(b)) \rightarrow \neg(\text{Large}(c) \vee \text{Large}(d))$   
 $(\text{Cube}(a) \wedge \neg \text{Cube}(b)) \rightarrow (\neg \text{Large}(c) \wedge \neg \text{Large}(d))$
2.  $(\text{Adjoins}(b, d) \vee \text{Adjoins}(a, d)) \rightarrow (\text{Large}(c) \wedge \text{Tet}(c))$
3.  $(\text{Dodec}(d) \rightarrow \neg \text{Dodec}(c)) \wedge (\text{Small}(b) \rightarrow \text{Cube}(a))$
4.  $(\neg \text{Small}(a) \vee \neg \text{Small}(b)) \wedge (\text{Cube}(c) \leftrightarrow \text{Cube}(d))$
5.  $\neg(\text{Adjoins}(a, c) \wedge \text{Adjoins}(b, c)) \vee \text{Dodec}(d)$   
 $\neg \text{Dodec}(d) \rightarrow \neg(\text{Adjoins}(a, c) \wedge \text{Adjoins}(b, c))$   
 $(\text{Adjoins}(a, c) \wedge \text{Adjoins}(b, c)) \rightarrow \text{Dodec}(d)$   
 $\neg \text{Dodec}(d) \rightarrow (\neg \text{Adjoins}(a, c) \vee \neg \text{Adjoins}(b, c))$
6. If  $c$  is cube that isn't small, it either adjoins  $d$  or is in front of it.  
 $c$  is a non-small cube only if it either adjoins or is in front of  $d$ .
7.  $d$  adjoins  $c$  if and only if  $b$  is not a large tetrahedron.  
 $d$  adjoins  $c$  just in case  $b$  is not a large tetrahedron.
8.  $(\text{LeftOf}(b, c) \vee \text{LeftOf}(c, b)) \rightarrow (\text{Large}(b) \vee \text{Large}(c))$
9.  $(\text{Cube}(b) \wedge \text{SameCol}(b, d)) \rightarrow b = d$
10.  $\text{Cube}(b) \wedge (\text{SameCol}(b, d) \rightarrow b = d)$

### Argument:

	$((\text{Dodec}(d) \wedge \neg \text{FrontOf}(d, c)) \vee \text{Cube}(d)) \rightarrow \text{Large}(d)$
	$(\text{Dodec}(d) \wedge \text{FrontOf}(d, c)) \rightarrow \text{Tet}(b)$
	$\text{Dodec}(d) \wedge \neg \text{Tet}(b)$
	_____
	$\text{Large}(d)$

The argument is valid. To see whether you can prove it, open [MidtermPrep1.prf](#) on the Supplementary Exercises page, under Chapter 8. The best strategy is proof by cases, with the two cases being  $\text{FrontOf}(d, c)$  and  $\neg \text{FrontOf}(d, c)$ . You may use **TautCon** to introduce the disjunction of these two cases, which is an instance of Excluded Middle.

If you get stuck and want to see a completed proof, open [ProofMidtermPrep1.prf](#)
